Application for Android Developer

Dear Hiring Team,

I am applying for the Android Developer position. I have worked independently as an Android Kotlin developer since March 2023 and developed 10 Android applications from March through October 2026 using Kotlin, Jetpack Compose, Room, and Material 3. Nine are published on Google Play, with one in review, and my portfolio provides application details and direct store links.

My applications demonstrate hands-on delivery of declarative user interfaces and varied mobile functionality. They include camera, video, audio, screen recording and editing, background recording, document scanning and PDF creation, local Wi-Fi communication, calendars and recurring events, search, backup, sharing, and export. I built privacy-focused workflows using secure local storage and offline or on-device processing, including applications that operate without cloud services or user accounts where applicable. I also prepared store listings and privacy policies and configured one-time premium feature unlocks through Google Play Console.

I bring additional depth from more than 25 years of enterprise software and database work. At CURI Medical Mutual Insurance, I developed Java, Python, and PL/SQL solutions and worked in an Agile environment using Git, GitHub, and Jira. This experience strengthened my approach to requirements, data validation, reliable implementation, and production support.

Thank you for considering my application. I would welcome the opportunity to discuss how my shipped Android portfolio and broader engineering background could support your team.

Sincerely,

Mike Hou
