APPLICATION FOR ANDROID APP DEVELOPER

Dear Hiring Team,

I am applying for the Android App Developer position with Corporate Tools. From March through September 2026, I designed and developed seven Kotlin Android applications using Jetpack Compose, Room, and Material 3 and published them on the Google Play Store. I have taken varied product ideas through implementation and release, and my Android app portfolio provides screenshots, feature summaries, and direct Google Play links.

Your focus on private mobile communication particularly interests me. LullabyCam connects two Android phones over local Wi-Fi for private live video, audio, and two-way talk without requiring a cloud service or account. My other applications include background audio recording, motion-triggered video, front/rear/dual-camera recording, offline processing, private local storage, and protected media. Although this is not commercial VoIP experience, it reflects practical work with privacy-conscious communication and media features on Android.

I also bring more than 25 years of enterprise software and database experience. At CURI Medical Mutual Insurance, I developed Java, Python, and PL/SQL solutions, supported production systems, performed data validation, and worked in an Agile team using GitHub, Git, and Jira. At Sanmina, I supported applications and collaborated with distributed development teams. This background gives me a disciplined approach to requirements, troubleshooting, collaboration, and dependable delivery.

I want to address the tenure requirement directly: my focused Android development began in March 2026, so it is newer than the requested one year. My documented experience also does not yet include commercial VoIP, mobile API integration, or continuous-integration pipelines. I would bring seven shipped Android applications, deep software-development experience, and the ability to learn unfamiliar systems while being candid about those growth areas.

Thank you for considering my application. I would welcome the opportunity to help Corporate Tools build useful, private Android applications for its customers.

Sincerely,

Mike Hou
