Application for Senior Android Developer

Dear Recruiting Team,

I am applying for the Senior Android Developer opportunity supporting your client. From March through September 2026, I designed and developed seven Kotlin Android applications using Jetpack Compose, Room, and Material 3 and published them on the Google Play Store. My Android app portfolio provides screenshots, feature summaries, and direct store links.

The applications span travel, productivity, document scanning, home security, automotive video, audio recording, and family monitoring. I implemented user-facing interfaces, camera and media features, live video and audio, two-way talk, background recording, offline and on-device processing, local storage, search, backup and restore, storage rotation, sharing, and export. This portfolio demonstrates my ability to take mobile products from concept through implementation and release.

I also bring more than 25 years of enterprise software and database experience. At CURI Medical Mutual Insurance, I developed Java, Python, and PL/SQL solutions, supported production systems, performed data validation, worked in an Agile team using GitHub, Git, and Jira, and administered AWS RDS for Oracle. My work supported enterprise insurance applications, regulatory reporting, and product configuration across 47 states. At Sanmina, I supported Java- and SQL-based applications and collaborated with distributed teams serving global operations.

I want to be transparent about fit: my focused Android experience began in March 2026 rather than meeting the requested five-to-eight-year tenure. My documented background also does not include the posting’s specified Android architectures, Retrofit or WebSocket integrations, JUnit or Espresso testing, performance profiling, CI/CD pipelines, or formal Android-team mentorship. I would bring seven shipped applications and deep enterprise engineering experience while approaching those areas as explicit growth priorities—not claiming experience I have not earned.

Thank you for considering my application. I would welcome a conversation about whether my demonstrated Android delivery and broader senior engineering background could meet your client’s needs.

Sincerely,

Mike Hou
