Application for Software Engineer 2 – Mobile Development

Dear Hiring Team,

I am applying for the Software Engineer 2 – Mobile Development position on the Garmin Labs Team in Cary. From March through September 2026, I designed and developed seven consumer-facing Kotlin Android applications using Jetpack Compose, Room, and Material 3 and published them on the Google Play Store. My Android app portfolio provides screenshots, feature summaries, and direct store links.

These applications span travel, productivity, document scanning, home security, automotive video, audio recording, and family monitoring. I implemented user-facing interfaces, camera and media features, live video and audio, two-way talk, background recording, offline and on-device processing, local data storage, search, backup and restore, storage management, sharing, and export. Developing one application per month required me to evaluate functionality, solve implementation problems, and carry each product from concept through release.

I also bring more than 25 years of software and database experience. At CURI Medical Mutual Insurance, I developed Java, Python, and PL/SQL solutions, translated requirements into reliable components, performed data validation, supported production systems, and worked in an Agile team using GitHub, Git, and Jira. At Sanmina, I supported Java- and SQL-based applications and collaborated with distributed teams serving global operations. My MS in Computer Science included a 3.8 GPA.

My focused Android experience began in March 2026, so it is newer than a full year; I offer extensive related software experience alongside seven shipped applications. My documented mobile work does not yet include Bluetooth or BLE, REST-based mobile APIs, or the specific build, debugging, and profiling tools listed in the posting. I would approach those as clear development priorities while contributing proven Kotlin, Java, Compose, Agile, Git, and product-delivery experience.

Thank you for considering my application. I would welcome the opportunity to contribute to mobile products from Garmin’s Cary team.

Sincerely,

Mike Hou
