Application for Android Developer

Dear Hiring Manager,

I am applying for the Android Developer position with Photon's Digital Engineering team in Durham. Since March 2026, I have designed, developed, and published seven Kotlin Android applications on the Google Play Store using Jetpack Compose, Room, and Material 3. These production applications demonstrate my ability to turn varied product ideas into responsive, user-focused mobile experiences and carry them through release. Screenshots, feature summaries, and Google Play links are available in my Android app portfolio.

My portfolio includes travel and productivity tools, a document scanner and PDF creator, motion-detection and dashcam applications, a background audio recorder, and a local Wi-Fi baby monitor. Across these applications, I implemented camera, video, and audio capabilities; offline and on-device processing; local data storage; background recording; search; backup and restore; sharing; export; and two-way local communication. This work aligns well with Photon's focus on Android application development, intuitive UI implementation, application reliability, and production-ready delivery.

I also bring more than 25 years of enterprise software and database experience. At CURI Medical Mutual Insurance, I developed Java, Python, and PL/SQL solutions, performed data validation, supported production systems, and worked in an Agile team using Jira and GitHub. Earlier, I supported Java- and SQL-based applications used by global teams. That background gives me a disciplined approach to requirements, maintainability, troubleshooting, and dependable delivery.

I want to address the experience requirements directly: my focused Android Kotlin work is recent rather than five years, and my documented portfolio does not yet include Espresso, UI Automator, MockK, or Compose testing frameworks. I would bring proven software-development depth, seven shipped Android applications, and a strong quality and validation mindset while quickly expanding my Android automated-testing practice.

Thank you for considering my application. I would welcome the opportunity to discuss how my recent Android delivery record and long enterprise-development background could contribute to Photon.

Sincerely,

Mike Hou
